A.C.O
Alan’s Club Organization

By Simoni Handoo

Database Management Project

Professor Alan Labouseur

A.C.O
Alan's
Club
Organization

TABLE OF CONTENTS

Executive Summary

Alan's Club Organization is a start-up organization located right across Marist College. It was recently founded by Alan and it consists of clubs that were founded by Alan, members in each club, and instructors for each club. It stores all the clubs along with their accompanying members, instructors, names of the club, start and end date, and so on. It keeps track of which instructor instructs which club in which season, and the members who are enrolled in which season. The database also consists of tables for storing the different meetings and events that are held by different clubs. The database also keeps track of the equipments needed for each club. A.C.O database is helpful since we can use this to track which members are in which club, or if they are in multiple clubs. It also keeps track of all the meetings and events that were held within each club and who attended those meetings/events to keep track of members who are loyal. This database has a separate table for confidential information for both members and instructors which includes how much they pay/earn, when their expiration/contract expires and what type of payment method they use.

Alan, who is the creator of this database, is also an instructor at this organization. Hence, a role called 'admin' has been created for Alan in the database since he is the one who can access all information. In this database, a member can only be a member, he/she cannot be an instructor if they are enrolled as a member.

SUBQUERIES

This subquery returns first and last name of the member who attended the club meeting “Choosing Partners” (with meeting_id =3). This query can be used to find out which member has attended which meetings in order to keep track of the meetings that take place.

```
SELECT first_name, last_name
FROM People
WHERE people_id IN (SELECT member_id
                    FROM Members
                    WHERE member_id IN (SELECT meeting_id
                                        FROM meeting_attendances
                                        WHERE meeting_id = 3)
                         );
```

first_name character varying(100)	last_name character varying(100)
Grace	Helbig

This subquery returns the first and last name of the instructors who are currently an instructor for the ongoing season (Spring2017). Using this query, we can find out which member was part of which Season if we ever want to do a look up.

```
SELECT first_name, last_name
FROM People
WHERE people_id IN (SELECT instructor_id
                    FROM Instructors
                    WHERE instructor_id IN (SELECT instructor_id
                                            FROM instructors_clubs
                                            WHERE season_id = 9 )
                   );
```

STORED PROCEDURES

This stored procedure returns the number of meeting(s) a member attended for a particular club in a particular semester.

```
DROP FUNCTION IF EXISTS memberForMeetings(int, int, int);
CREATE FUNCTION memberForMeetings (club_id INT, season_id INT, member_id INT)
RETURNS BIGINT as $$
SELECT count(cm.meeting_id) as Attendances
FROM club_meetings cm, meeting_attendances ma, Season
WHERE cm.club_id = $1
AND cm.start_time >= Season.start_date
AND cm.start_time <= Season.end_date
AND season.season_id = $2
AND ma.member_id = $3
AND cm.meeting_id = ma.meeting_id;
$$ language 'sql';
```

	totalmeetingsbyseason bigint
1	0

SELECT * FROM MemberForEvents(3,1,4);

This Stored Procedure returns the number of event(s) a member attended for a particular club in a particular season.

```
DROP FUNCTION IF EXISTS MemberForEvents(int, int, int);
CREATE FUNCTION MemberForEvents (event_id int, season_id int, member_id
int)
RETURNS BIGINT as $$
SELECT count(ce.event_id) as Attendances
FROM club_events ce, event_attendances ea, Season
WHERE ce.start_time >= season.start_date
AND ce.start_time <= season.end_date
AND season.season_id = $2
AND ea.member_id = $3
AND ce.event_id = ea.event_id
$$ language 'sql';
```

```
SELECT * FROM memberForEvents(3,2,4);
```

	memberforevents bigint
1	0

This Stored Procedure basically awards points to a member that has been a loyal Client at the A.C.O. If a member has been part of a lot of club meetings for different clubs, this stored procedure will return a boolean value. If it returns true, this member will gain points, which are basically future benefits and discounts (such as a free 1 month membership).. If a member gains enough points, they will be rewarded.

```
DROP FUNCTION IF EXISTS rewardPoints(int, int, int);
CREATE FUNCTION rewardPoints(season_id int, club_id int, member_id int)
RETURNS BOOLEAN as $$
SELECT (100 * memberForMeetings(members_clubs.club_id, members_clubs.season_id,
members_clubs.member_id) / totalMeetingsBySeason(members_clubs.club_id,
members_clubs.season_id) >= 50
    AND memberForMeetings(members_clubs.club_id, members_clubs.season_id,
members_clubs.member_id)/ totalMeetingsBySeason(members_clubs.club_id,
members_clubs.season_id) >= 50)
FROM members_clubs, season
WHERE members_clubs.season_id = $1
AND members_clubs.club_id = $1
AND members_clubs.member_id = $2;
$$ language 'sql';
SELECT * FROM rewardPoints(1,1,2);
```

This stored procedure returns the total number of records that are in the People's table

```
CREATE OR REPLACE FUNCTION totalRecords()
RETURNS integer AS $total$
declare
    total integer;
BEGIN
   SELECT count(*) into total FROM People;
   RETURN total;
END;
$total$ LANGUAGE plpgsql;

select totalrecords();
```

totalrecords integer
20

This function returns the cost to Alan's Club Organization for Instructors

```
CREATE OR REPLACE FUNCTION totalSalary()
RETURNS money AS $salary$
declare
     salary money;
BEGIN
   SELECT SUM(monthly_salary_usd) into salary FROM instructors;
   RETURN salary;
END;
$salary$ LANGUAGE plpgsql;

SELECT totalSalary();
```

totalsalary money
$2,300.00

This stored procedure returns the amount of profit that A.C.O is making through membership

```
CREATE OR REPLACE FUNCTION totalFees()
RETURNS money AS $Fee$
declare
    Fee money;
BEGIN
   SELECT SUM(monthly_fee_usd) into Fee FROM members;
   RETURN Fee;
END;
$Fee$ LANGUAGE plpgsql;

select totalFees() - totalSalary() AS Profit;
```

profit money
$227.00

TRIGGERS

New member who decided to join a club must be managed by this database separately using this trigger. This example triggers on a new member entry being created.

```
CREATE OR REPLACE FUNCTION new_member ()
RETURNS trigger AS $$
BEGIN
     IF NEW.is_member = true THEN
     INSERT INTO Members VALUES (NEW.member_id, NEW.start_date);
     END IF;
     RETURN NEW;
END;
$$ LANGUAGE plpgsql;
```

```
CREATE TRIGGER add_member
AFTER INSERT OR UPDATE ON People
FOR EACH ROW
EXECUTE PROCEDURE new_member();
```

New instructor(s) who have been hired by Alan to instruct a club must be managed by this database separately using this trigger. This example triggers on a new instructor entry being created.

```
CREATE OR REPLACE FUNCTION new_instructor ()
RETURNS trigger AS $$
BEGIN
     IF NEW.is_instructor = true THEN
     INSERT INTO Instructors VALUES (NEW.instructor_id, NEW.start_date);
     END IF;
     RETURN NEW;
END;
$$ LANGUAGE plpgsql;
```

```
CREATE TRIGGER add_instructor
AFTER INSERT OR UPDATE ON People
FOR EACH ROW
EXECUTE PROCEDURE new_instructor();
```

This trigger checks that the end date comes after the start date when inserting into or updating the Season table. If the end date is entered before the start date, it throws an exception.

```
CREATE OR REPLACE FUNCTION date_order() RETURNS trigger
AS $date_order$
BEGIN
     IF NEW.start_date > NEW.end_date THEN
          RAISE EXCEPTION 'end date % should come after
          start_date %.', NEW.start_date, NEW.end_date;
     END IF;
     RETURN NEW;
END;
$date_order$ LANGUAGE plpgsql;

    CREATE TRIGGER check_season_dates
     BEFORE INSERT or UPDATE
     ON season
     FOR EACH ROW EXECUTE PROCEDURE date_order();
```

SECURITY IMPLEMENTATION

GRANT FOR ADMINS (main admin, equipment admin and events admin)

```
CREATE role
databaseadmin;
GRANT ALL ON ALL TABLES
IN SCHEMA PUBLIC
TO databaseadmin;
```

```
CREATE role EquipmentAdmin;
GRANT SELECT, INSERT, UPDATE,
DELETE ON Equipment,
ClubsEquipment, existing_clubs
TO EquipmentAdmin;
```

```
CREATE role eventsadmin;
GRANT SELECT, INSERT, UPDATE,
DELETE ON club_meetings,
club_events,
meeting_attendances,
event_attendances
TO eventsadmin;
```

GRANT FOR Instructors and Members

```
CREATE ROLE instructors;
GRANT SELECT, INSERT, UPDATE ON
Members, members_clubs, club_events,
club_meetings, ClubsEquipment,
Season, meeting_attendances,
event_attendances, existing_clubs
TO instructors;
```

```
CREATE ROLE members;
GRANT SELECT ON members, members_clubs,
club_events, Season, club_meetings,
meeting_attendances, event_attendances,
ClubsEquipment, existing_clubs
TO members;
```

REVOKE (no one apart from the admin should have access to the following columns)

```
REVOKE ALL PRIVILEGES ON People FROM Members;

REVOKE ALL PRIVILEGES ON Instructors FROM Members;

REVOKE ALL PRIVILEGES ON instructors_clubs FROM Members;

REVOKE ALL PRIVILEGES ON Instructors FROM Members;

REVOKE ALL PRIVILEGES ON event_attendances FROM Members;

REVOKE ALL PRIVILEGES ON meeting_attendances  FROM Members;
```

Implementation Notes and Known Problems

Implementation Notes:

- The purpose of this database is to allow Alan's Club Organization to run smoothly. As the club organization becomes more known/popular, people are going to enroll themselves in different clubs. We need to keep track of who is enrolled in which club, how much they are paying, when their membership expires, etc.
- This database not only keeps track of assigning a club to a member, but it also keeps track of members' and instructors' personal information (payment method, how much they pay, etc.)
- Another purpose of the database is to overlook the equipments each club needs. The organization needs to be informed about getting any other types of equipment that might be needed by a certain club.
- **TEST DATA:** The test data that was added in this database is dummy data (randomly generated).

Known Problems:

- You cannot create a view of members and instructors simultaneously from the People's table.
- There is no relationship between Season and Members or Season and Instructors, which means we cannot run a ***FAST*** query that would return which Member was enrolled in which season.
- To find out which member pays how much for a club, we have to go through 4 tables (members_info → members → meeting_attendances → club_meetings → existing_clubs). This is not very efficient since we shouldn't have to go through club_meetings table if we are just trying to find out which member pays how much for which club, there should be a direct relationship (link) between the two entities.

Future Enhancements

- I would probably make a few changes in my database. First of all, I would create a table called “Benefits”. I would add attributes such as “reward_points” and “num_of_clubs” which would contain how many clubs a member is enrolled in. If a member is enrolled in a lot of clubs, he or she will gain benefits such as discounts, a free 1 month membership etc. This would attract more potential clients. This would also serve as a great marketing/advertising scheme.
- Secondly, I would create a table for guests. The “Guests” table would contain attributes such as “guest_name” and “hourly_fee”. The Guests table is for people who would like to attend a club on the spot. A guest could be a family member or a friend of one of the enrolled members. Guests can use the club services but they would not have access to club benefits. For example, the Guests table would have no relationship with the “reward_points” table since it is not applicable to them.
- I would add a table for “payment_transactions” so that it would be easier to keep track of
- Thirdly, to fix the known problems that exist in the database, I will try to reduce the number of tables it takes to return a query for better results. For example, to get how much a member pays for a certain club, I would like to reduce the number of queries the database has to go through and try to create an associative entity which would link the 2 tables together.

THE END
